DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-4, 6-9, 11-15 are rejected under 35 U.S.C. 102(e) as being anticipated by Macedo et al. (2003/0199259).

Regarding claim 1, Macedo discloses a load circuit (#140) in a transmitter for controlling frequency range between a first and a second circuit (figs.6-7), the load circuit, comprising: a first inductor (L in a left side) having a first terminal connected to a first node and a second terminal connected to a supply node (Vcc); and a first varactor (Cv in a left side) having a first terminal connected to the first node and a second terminal connected to a control signal (V ctrl) (paragraph 24).

Regarding claims 6, 12, these claims are rejected for the same reason as set forth in claim 1.

Regarding claims 2, 7, 13, since Macedo disclosed that the control signal tunes a signal to a center (desired) frequency, the transmitter inherently includes a control signal generator (paragraphs 27-32).

Art Unit: 2618

Regarding claims 3-4,8-9, 14-15, Macedo further discloses a second inductor (L in a right side) and a second varactor (Cv in the right side) (fig.6); and wherein the control signal (Vctrl) adjusts the capacitance of the first and second varactor, wherein the first and second inductors having a first terminal connected to the first node , a center tap terminal connected to the supply node (Vcc) (paragraphs 24-27).

Regarding claim 11, Macedo further discloses adjusting the capacitance to match an output impedance (paragraphs 29-32)

Allowable Subject Matter

3. Claims 5, 10, and 16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Regarding claims 5, 10, and 16, the prior art of record does not specifically discloses the control signal generator comprising a plurality of resistors connected in series between the supply node and ground and a plurality of switch element connected between the terminals of the resistor and the control signal.

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Simon Nguyen whose telephone number is (571) 272-7894. The examiner can normally be reached on Monday-Friday from 7:00 AM to 4:00PM.
